

MASTABLOT TP

MASTABLOT TP is a line blot assay for the detection of either IgM or IgG specific antibodies to *Treponema pallidum* from either plasma or serum.

The MASTABLOT TP is a highly specific confirmatory assay for syphilis infections and can detect the antigens TpN15, TpN17, TmpA & TpN47.

Ready to use reagents and simple storage conditions reduces assay preparation and hands on time. Confidence in results is ensured by the inclusion of serum & cut-off controls.

For further information on the MASTABLOT TP, [please click here](#).
