

New Deep Well Blocks with low profile from Porvair Sciences

Dunn Labortechnik presents the new deep well blocks with low profile for high-throughput applications from Porvair Sciences.

The deep well blocks are stackable, autoclavable, conform to ANSI/SLAS standards, and have raised rims for a reliable closure with heat sealing mats - which are also available from Dunn Labortechnik.

The low profile of the plates is ideal for automation such as applications with liquid handling systems. For the performance of bioassays, the plates are manufactured DNase- and RNase-free and do not contain any slip agents, plasticizers or biocides. Centrifugation up to 6000 x *g* for faster protocols is possible due to a very good stability of the plates.

Furthermore, the plates can be equipped with optional barcodes.
