

FILTER FLOCS

- Bulky mass of dry dispersed cellulose fibres which assist coagulation by forming a more flocculent suspension.
- Filter aids transform difficult precipitates and colloidal particles into a form
- It can be filtered more easily.
- When slimy and strongly lyophilic, swelling precipitates are involved
- The fibres of the filter floccs prevent formation of a continuous, impermeable layer on the filter.
- The resulting filter cake remains porous and permeable, and clogging of the filter is prevented.
